ABSTRACT

Since 1492, humanity's knowledge has been developed aggressively. After less than five hundred years of inventing the printed books, man has succeeded in inventing the printed circuits and thus developed computational power and speed unprecedentedly. In the few coming years, man will change the world by a set of disruptive changes, using mind-blowing technologies and ubiquitous computing. Simply, humanity is beginning a new industrial era that is transforming how we think, learn, and live! People who will understand the change, and will be able to cope with, are the people who will be able to succeed in the future, and others will die, or at least live as dead! This lecture will take the audience on a journey through history. It will also navigate through the present to make them understand what will happen soon in the future. It is highly recommended to be attended by different types of backgrounds. This session is a type of enlightenment session, so no demos are expected. (Hill, 2020)
